Fire risk report for Aglaomorpha rigidula

Full Species Name

Aglaomorpha rigidula (Sw.) Hovenkamp & S.Linds.

Family: Polypodiaceae

Common names:

basket fern

Synonyms:

Drynaria rigidula

Known occurrences (as of 2020)

Year first documented as naturalized in Hawai'i: 2012

This species has not yet been ranked by the Hawai'i Weed Risk Assessment program as of 2020.

0 I .5 1 Lowest risk \Leftrightarrow Highest risk

This species is likely a **low** fire risk in Hawai'i with a fire risk score of **0.16**.

This species was ranked by our machine learning algorithm using the data presented on the next page. A predicted score of > .34 suggests the plant is a high fire risk.

Summary of Fire ecology			
Native habitat fire proneness	Fire-prone		
Fire promoting plant in its native range	No		
Fire promoting plant in its introduced range*	No		
Regenerates after fire	Yes		
Promoted by fire	no data		
Reported flammable*	No Data		
Relative is flammable*	No		

^{*}These values were used by the model to predict fire risk

Detailed summary of Fire Ecology

Native habitat fire proneness (In any part of the plant's native range is its habitat described as fire prone due to natural or human caused fires?)	Fire- prone	#lists fire as highly degrading the habitat and reverting it to grassland, lists this species as occuring. Franklin, J. A. N. E. T., Keppel, G. U. N. N. A. R., & Whistler, W. A. (2008). The vegetation and flora of Lakeba, Nayau and Aiwa islands, central Lau Group, Fiji. Micronesica, 40(1/2), 169-225.
		"The ground flora, most of which is perennial, is at its maximum density during the latter part of the rainy season (September-November) and absent during the dry, fire-prone season (February-May). [list D. rigidula as occuring]"
		"This species loves to grow on rocks where it can escape from fires relatively unscathed. It can tolerate some fire, as long as it's not too hot and its rhizomes (roots) are left intact." http://friendsofplunkett.org.au/basket-fern-drynaria-rigidula/
Fire promoting plant in its native range (Does the species act as a major fuel source, increase fire severity, frequency, or modify fuel bed characteristics within its native range?)	No	
Fire promoting plant in its introduced range (Same as Fire Promoting Native but within the species introduced range)	No	
Regenerates after fire (Does the plant regrow after fire by any means? This includes resprouters, reseeders, and recruiters which dispersed into the area	Yes	"This species loves to grow on rocks where it can escape from fires relatively unscathed. It can tolerate some fire, as long as it's not too hot and its rhizomes (roots) are left intact." #evades fire by growing in areas where fire does not burn (on rocks)

The data presented were assembled from literature and database searches for each species using as much data as could be collected regarding the plant's fire ecology under natural conditions. Searches aimed to be exhaustive and consist of as much data as could be located in 2020. Our machine learning algorithm was trained on 49 species of plants which had their fire risk ranked by 49 managers in Hawai'i in November 2020. The model used a conditional random forest regression algorithm to predict scores for each species using the manager score as the response variable and the fire ecology traits of each plant as the predictor variables to generate a fire risk score. This trained model was then used to predict the fire risk for all species which were not ranked by managers. The model was calibrated such that it is 90% accurate at predicting high fire risk plants and 79% accurate at predicting low fire risk plants. This research and the resulting fire risk model has been published in the journal <u>Biological Invasions</u> by <u>Kevin Faccenda</u> and <u>Curt Daehler</u> (both at the University of Hawai'i at Mānoa).

Note that the analysis doesn't account for a plant species' spatial distribution, population density, or distinct climate and ecosystem conditions (which can also influence fire risk). The fire risk of these species are mostly under "worst case" environmental conditions where the climate is dry enough to maintain fire, but wet enough to allow for plant growth and fuel accumulation. The fire risk ranking should not be taken as a stand-alone risk metric in prioritizing weed control

efforts. Rather, this information may also be useful for determining if a newly discovered species poses a potential fire threat in wildland areas.

More general information on the weed risks and ecology of non-native plants in Hawai'i is available from the Hawai'i Invasive Species Committee's <u>Weed Risk Assessment database</u>.
