

## Fire risk report for *Leonotis nepetifolia*

<b>Full Species Name</b> <i>Leonotis nepetifolia</i> (L.) R.Br.
<b>Family:</b> Lamiaceae
<b>Common names:</b> lion's ear
<b>Synonyms:</b>
Known occurrences (as of 2020) 
Year first documented as naturalized in Hawai'i: 1942
This species has been ranked by the Hawai'i Weed Risk Assessment program as High Risk with a score of 19.

0                      **I**                      .5                      1  
Lowest risk                      ⇔                      Highest risk

This species is likely a **low** fire risk in Hawai'i with a fire risk score of **0.16**.

This species was ranked by our machine learning algorithm using the data presented on the next page. A predicted score of > .34 suggests the plant is a high fire risk.

Summary of Fire ecology	
Native habitat fire proneness	No Data
Fire promoting plant in its native range	No
Fire promoting plant in its introduced range*	No
Regenerates after fire	Yes
Promoted by fire	Yes
Reported flammable*	No Data
Relative is flammable*	No

\*These values were used by the model to predict fire risk

## Detailed summary of Fire Ecology

Native habitat fire proneness (In any part of the plant's native range is its habitat described as fire prone due to natural or human caused fires?)	No Data	
Fire promoting plant in its native range (Does the species act as a major fuel source, increase fire severity, frequency, or modify fuel bed characteristics within its native range?)	No	
Fire promoting plant in its introduced range (Same as Fire Promoting Native but within the species introduced range)	No	
Regenerates after fire (Does the plant regrow after fire by any means? This includes resprouters, reseeder, and recruiters which dispersed into the area within approximately one year post fire)	Yes	<p>"Although small plants are obviously affected by fire, there is no evidence to suggest that all plants subsequently die—nor could evidence be found of an attempt to determine if they do. Some plants could conceivably survive to flower and fruit. Given that this is one of the primary reasons for burning in the first place, field observations to confirm the responses of plants of different ages to fire is warranted" #maybe?</p> <p><a href="http://caws.org.nz/old-site/awc/2012/awc201210531.pdf">http://caws.org.nz/old-site/awc/2012/awc201210531.pdf</a></p> <p>Clarkson, J. R., Grice, A. C., &amp; Dollery, C. (2012). Chasing the lion's tail. The value of program review: a case study from the management of <i>Leonotis nepetifolia</i> (L.) R. Br. on Rinyirru (Lakefield) National Park. In Proceedings of the 18th Australasian Weeds Conference (pp. 53-56).</p> <p>-----</p> <p>"However, the same fire regime that controls some weeds may promote others. Frequent burning that may reduce lantana populations can increase the populations of annuals</p>

		and other short lived weeds. Lion's tail ( <i>Leonotis nepetifolia</i> ) and grader grass ( <i>Themeda quadrivalvis</i> ) are examples." Williams, P. R. (2014). Increased complexity in fire management raises practical research questions. Proceedings of the Royal Society of Queensland, The, 119, 91.
Promoted by fire (Does the plant increase in abundance after a fire?)	Yes	"However, the same fire regime that controls some weeds may promote others. Frequent burning that may reduce <i>lantana</i> populations can increase the populations of annuals and other short lived weeds. Lion's tail ( <i>Leonotis nepetifolia</i> ) and grader grass ( <i>Themeda quadrivalvis</i> ) are examples." Williams, P. R. (2014). Increased complexity in fire management raises practical research questions. Proceedings of the Royal Society of Queensland, The, 119, 91.
Reported flammable (Is the species described as being flammable, being a major wildfire fuel, or high fire risk?)	No Data	
Relative is flammable (Does a plant in the same genus meet the Reported Flammable criteria?)	No

The data presented were assembled from literature and database searches for each species using as much data as could be collected regarding the plant's fire ecology under natural conditions. Searches aimed to be exhaustive and consist of as much data as could be located in 2020. Our machine learning algorithm was trained on 49 species of plants which had their fire risk ranked by 49 managers in Hawai'i in November 2020. The model used a conditional random forest regression algorithm to predict scores for each species using the manager score as the response variable and the fire ecology traits of each plant as the predictor variables to generate a fire risk score. This trained model was then used to predict the fire risk for all species which were not ranked by managers. The model was calibrated such that it is 90% accurate at

predicting high fire risk plants and 79% accurate at predicting low fire risk plants. This research and the resulting fire risk model has been published in the journal [Biological Invasions](#) by [Kevin Faccenda](#) and [Curt Daehler](#) (both at the University of Hawai'i at Mānoa).

Note that the analysis doesn't account for a plant species' spatial distribution, population density, or distinct climate and ecosystem conditions (which can also influence fire risk). The fire risk of these species are mostly under "worst case" environmental conditions where the climate is dry enough to maintain fire, but wet enough to allow for plant growth and fuel accumulation. The fire risk ranking should not be taken as a stand-alone risk metric in prioritizing weed control efforts. Rather, this information may also be useful for determining if a newly discovered species poses a potential fire threat in wildland areas.

More general information on the weed risks and ecology of non-native plants in Hawai'i is available from the Hawai'i Invasive Species Committee's [Weed Risk Assessment database](#).
