# Fire risk report for *Tillandsia juncea*

Full Species Name   *Tillandsia juncea* (Ruiz & Pav.) Poir.
Family: Bromeliaceae
Common names: air plant
Synonyms:
Known occurrences (as of 2020)
Year first documented as naturalized in Hawai'i: 2008
This species has not yet been ranked by the Hawai'i Weed Risk Assessment program as of 2020.

0   **|**   .5   1

Lowest risk   ⇔   Highest risk

This species is likely a **low** fire risk in Hawai'i with a fire risk score of **0.16**.

This species was ranked by our machine learning algorithm using the data presented on the next page. A predicted score of > .34 suggests the plant is a high fire risk.

Summary of Fire ecology	
Native habitat fire proneness	Non Fire-prone
Fire promoting plant in its native range	No
Fire promoting plant in its introduced range*	No
Regenerates after fire	No Data
Promoted by fire	No Data
Reported flammable*	No Data
Relative is flammable*	No

*These values were used by the model to predict fire risk

Detailed summary of Fire Ecology

Native habitat fire proneness (In any part of the plant's native range is its habitat described as fire prone due to natural or human caused fires?)	Non Fire-prone	"common, widespread species in most of the Neotropics south of the Tehuantepec Isthmus, and only marginally enter into the southern most portions of Mexico. All of them are restricted to some of the wettest portions of the Peninsula, either in Tropical Rain Forests ("Tall Evergreen Forest," TEF) or to "tíntales" ("Low-statured flooded forests," LSFF . . . Tillandsia juncea is rarer and more local but seems widespread in the general Calakmul area, growing in LSFF and also in MSSF, associated with other locally rare epiphytic taxa such as Mormolyca ringens (Lindl.) Schltr. (Orchidaceae) and Tillandsia polystachy" Ramirez, Ivon, and German Carnevali. "A NEW SPECIES OF TILLANDSIA, SOME NEW RECORDS, AND A CHECKLIST OF THE BROMELIACEAE FROM THE YUCATAN PENINSULA." Harvard Papers in Botany 4, no. 1 (September 1999): 185–94.
Fire promoting plant in its native range (Does the species act as a major fuel source, increase fire severity, frequency, or modify fuel bed characteristics within its native range?)	No	
Fire promoting plant in its introduced range (Same as Fire Promoting Native but within the species introduced range)	No	
Regenerates after fire (Does the plant regrow after fire by any means? This includes resprouters, reseeders, and recruiters which dispersed into the area within approximately one year post fire)	No Data	

Promoted by fire (Does the plant increase in abundance after a fire?)	No Data	
Reported flammable (Is the species described as being flammable, being a major wildfire fuel, or high fire risk?)	No Data	
Relative is flammable (Does a plant in the same genus meet the Reported Flammable criteria?)	No

Text preceded by a "#" is comment from the assessor

The data presented were assembled from literature and database searches for each species using as much data as could be collected regarding the plant's fire ecology under natural conditions. Searches aimed to be exhaustive and consist of as much data as could be located in 2020. Our machine learning algorithm was trained on 49 species of plants which had their fire risk ranked by 49 managers in Hawaiʻi in November 2020. The model used a conditional random forest regression algorithm to predict scores for each species using the manager score as the response variable and the fire ecology traits of each plant as the predictor variables to generate a fire risk score. This trained model was then used to predict the fire risk for all species which were not ranked by managers. The model was calibrated such that it is 90% accurate at predicting high fire risk plants and 79% accurate at predicting low fire risk plants. This research and the resulting fire risk model has been published in the journal Biological Invasions by Kevin Faccenda and Curt Daehler (both at the University of Hawaiʻi at Mānoa).

Note that the analysis doesn't account for a plant species' spatial distribution, population density, or distinct climate and ecosystem conditions (which can also influence fire risk). The fire risk of these species are mostly under "worst case" environmental conditions where the climate is dry enough to maintain fire, but wet enough to allow for plant growth and fuel accumulation. The fire risk ranking should not be taken as a stand-alone risk metric in prioritizing weed control efforts. Rather, this information may also be useful for determining if a newly discovered species poses a potential fire threat in wildland areas.

More general information on the weed risks and ecology of non-native plants in Hawaiʻi is available from the Hawaiʻi Invasive Species Committee's Weed Risk Assessment database.
